where is a Bessel function of the first kind, (a.k.a. J_n) is the Bessel function of the second kind (a.k.a. Neumann function or Weber function), and Y_n are constants. Complex solutions are given by the Hankel functions (a.k.a. Bessel functions of the third kind). The Bessel functions are orthogonal in according to

Green's Function. Generally speaking, a Green's function is an integral kernel that can be used to solve differential equations from a large number of families including simpler examples such as ordinary differential equations with initial or boundary value conditions, as well as more difficult examples such as inhomogeneous partial differential equations (PDE) with boundary conditions.

Integral equations as a generalization of eigenvalue equations. Certain homogeneous linear integral equations can be viewed as the continuum limit of eigenvalue equations. Using index notation, an eigenvalue equation can be written as $\sum_j M_{ij} v_j = \lambda v_i$ where $M = [M_{ij}]$ is a matrix, v is one of its eigenvectors, and λ is the associated eigenvalue. Taking the continuum limit, i.e., replacing the discrete ...

In mathematics, orthogonal functions belong to a function space which is a vector space that has a bilinear form. When the function space has an interval as the domain, the bilinear form may be the integral of the product of functions over the interval: $\int_a^b f(x)g(x)dx$. The functions f and g are orthogonal when this integral is zero, i.e. $\int_a^b f(x)g(x)dx = 0$ whenever $f \neq g$.

En mathématiques, et plus précisément en analyse, les fonctions de Bessel, appelées aussi quelquefois fonctions cylindriques [1], découvertes par le mathématicien suisse Daniel Bernoulli, portent le nom du mathématicien allemand Friedrich Wilhelm Bessel. Bessel développa l'analyse de ces fonctions en 1816 dans le cadre de ses études du mouvement des planètes induit par l'interaction ...
