Abstract. This article studied and compared the two nonprobability sampling techniques namely, Convenience Sampling and Purposive Sampling. Convenience Sampling and Purposive Sampling are Nonprobability Sampling Techniques that a researcher uses to choose a sample of subjects/units from a population. Although, Nonprobability sampling has a lot of limitations due to the subjective nature in choosing the sample and thus it is not good representative of the population, but it is useful ...

Convenience sampling and purposive sampling are two different sampling methods. This article first explains sampling terms such as target population, accessible population, simple random sampling, intended sample, actual sample, and statistical power analysis. These terms are then used to explain the difference between "convenience sampling" and purposive sampling." Convenience sampling is a ...

Convenience sampling is a method of collecting data samples from people or respondents who are easily accessible to the researcher. However, the pros and cons of convenience sampling presented here can't be denied that although it has some advantages, it also have disadvantages. Perhaps it depends on the type of research being conducted.

7 Pros and Cons of Convenience Sampling - Green Garage

Convenience sampling (also known as availability sampling) is a specific type of non-probability sampling method that relies on data collection from population members who are conveniently available to participate in study. Facebook polls or questions can be mentioned as a popular example for convenience sampling.

This sampling technique may be more appropriate for one type of study and less for another. Bias. The results of the convenience sampling cannot be generalized to the target population because of the potential bias of the sampling technique due to under-representation of subgroups in the sample in comparison to the population of interest.

The difference between probability and non-probability sampling are discussed in detail in this article. In probability sampling, the sampler chooses the representative to be part of the sample randomly, whereas in nonprobability sampling, the subject is chosen arbitrarily, to belong to the sample by the researcher.
