colorful shapes over hundreds and thousands of years. These vibrant metropolises provide food and shelter for millions of species of fishes, sea turtles, crustaceans and invertebrates — making coral reefs one of Earth's most diverse habitats.

Coral reefs | Habitats | Monterey Bay Aquarium

What are Coral Reefs. Appearing as solitary forms in the fossil record more than 400 million years ago, corals are extremely ancient animals that evolved into modern reef-building forms over the last 25 million years. Coral reefs are unique (e.g., the largest structures on earth of biological origin) and complex systems.

NOAA CoRIS - What are Coral Reefs

Reefs protect land from harsh weather by absorbing the impact from strong waves and storms. Reefs provide food, for example, lobster and conch. Coral reefs are also a huge tourist attraction.

Coral reefs are a big source of biodiversity. Without the reef, many of these plants and animals would die.

CORAL REEF - kids.nceas.ucsb.edu

Corals are animals, though, because they do not make their own food, as plants do. Corals have tiny, tentacle-like arms that they use to capture their food from the water and sweep into their inscrutable mouths. Most structures that we call "coral" are, in fact, made up of hundreds to thousands of tiny coral creatures called polyps.

Are corals animals or plants?

Corals are in fact animals. The branch or mound that we often call "a coral" is actually made up of thousands of tiny animals called polyps. A coral polyp is an invertebrate that can be no bigger than a pinhead to up to a foot in diameter. Each polyp has a saclike body and a mouth that is encircled by stinging

Coral reefs grow best in warm water (70–85° F or 21–29° C). Corals prefer clear and shallow water, where lots of sunlight filters through to their symbiotic algae. It is possible to find corals at depths of up to 300 feet (91 meters), but reef-building corals grow poorly below 60–90 feet (18–27 meters).
