Monte Carlo Simulation Simulation in system reliability analysis is based on the Monte Carlo simulation method that generates random failure times from each component's failure distribution. The overall system reliability is then obtained by simulating system operation and empirically calculating the reliability values for a series of time values.

The generation capacity states and the risk model were obtained using the sequential Monte Carlo simulation (MCS) method. The load was gradually increased stepwise and is simulated against the constant generation capacity. In each case, the reliability index was recorded in terms of loss-of-load evaluation (LOLE).

The product moment method of correlation is a significant method for estimating reliability of two sets of scores. Thus, a high correlation between two sets of scores indicates that the test is reliable. Means, it shows that the scores obtained in first administration resemble with the scores obtained in second administration of the same test.
