CSN-2.A.3 - Distributed computing is a computational model in which multiple devices are used to run a program. CSN-2.A.4 - Comparing efficiency of solutions can be done by comparing the time it takes them to perform the same task. CSN-2.A.5 - A sequential solution takes as long as the sum of all of its steps.

algorithms, mutual exclusion, program debugging, and simulation. Because I have chosen to write the book from the broader perspective of distributed-memory systems in general, the topics that I treat fail to coincide exactly with those normally taught in a more orthodox course on distributed algorithms.

Limitations of Distributed System – Difficult to design and debug algorithms for the system. These algorithms are difficult because of the absence of a common clock; so no temporal ordering of commands/logs can take place. Nodes can have different latencies which have to be kept in mind while designing such algorithms.

Distributed Algorithms - 1st Edition

Distributed computing is a field of computer science that studies distributed systems. A distributed system is a system whose components are located on different networked computers, which communicate and coordinate their actions by passing messages to one another. The components interact with one another in order to achieve a common goal. Three significant

Parallel and distributed genetic algorithms try to address it introducing differences between algorithms that make them to have different set of individuals. With parallel and distributed genetic algorithms individuals are more divergent, as a result it is possible to create less individuals than using non-parallel genetic algorithm, keeping solution quality at the same rates.
